ACCESS FLOORING

ULTRA LOW FIXED HEIGHT WIRE MANAGEMENT SYSTEM

OWNER'S MANUAL

CARE AND USE OF ASM ULTRA LOW FIXED HEIGHT WIRE MANAGEMENT SYSTEM

Q2C Access Flooring

Low-Profile Access Floor Systems are supplied and installed in conformance with the requirements set forth by individual specifications (09 69 33) and approved submittal documents.

Moving and Staging Heavy Loads:

It is always good practice to lay down 4'x8' plywood sheets, at a minimum thickness of $\frac{3}{8}$ ", in a continuous path before moving or installing equipment, fixtures or furnishings where there is concern about rolling load damages to the floor. The purpose of the protective sheet(s) is to disperse the rolling load potentials and provide a safe installation.

Always ensure that the resulting static load from placing or installing heavy equipment into final or temporary position does not exceed the Concentrated Load rating of the Low-Profile Access Floor System.

Wiring and Cable Routing:

Always exercise caution when routing telecommunications cables and electrical wiring within the access floor cavity. Do not use the understructure as a "cable pulley" or "cable roller" fulcrum point during the routing of electrical services or cabling. This can damage cabling and potentially dislodge the pedestal from its grid placement.

CARE AND USE OF ASM ULTRA LOW FIXED HEIGHT WIRE MANAGEMENT SYSTEM

Removing and Replacing Panels:

Remove a single floor panel by inserting a flat head screw driver into the notch on the edge of a panel at opposite corners and carefully pry the panel up from the understructure. Additional panels can easily be removed by hand. Always barrier or tape off all open floor cavity area from access by the public. Replace floor panels by aligning plate edge with understructure tabs and firmly push down with the palm of your hand or use a small rubber mallet to tap securely into place.

FLOOR EVALUATION

- Inspection: The ASM Q2C Access Floor must have a solid feel underfoot. Replace or repair any damaged parts, accessories and defects in workmanship. Obtain building owner, agent or general contractor acceptance of the completed section before any loads are applied or subsequent trade work such as carpet commences.

- Safety and Protection: The installed Low-Profile Access Floor System shall be protected from damage or work conducted by other trades until the final inspection has taken place. Plywood or other suitable load distribution material shall be laid in hallways, corridors or any material passageways entering the raised floor area.
